

## Features of Python are

1. It is a simple and easy programming language as compared to other programming language
2. It is dynamically typed language which means that when we are assigning a variable we don't have to specify the data type for the given variable , but in other programming languages like C++ we have to specify the data type for assigning a variable. Python by looking at the value of the variable decides the data type for that given variable.
3. It is an interpreted language i.e. the execution takes place line by line.
